

# ROLE-BASED ACCESS TO FILES

»The right data solely in the right hands.«

## Arguments for using conpal LAN Crypt in different departments in your company:

With **conpal LAN Crypt**, role-based access to files and directories can be defined granularly. This allows companies from SMEs to enterprise customers to ensure that data worth protecting can only be viewed by the persons who are authorized to do so.

## – BENEFITS –

### For the IT admin

»How can I administer all the servers and databases – including backups and cloud data – in the company without the requirement of access to the stored data and bearing the associated responsibility?«

### For the data protection officer

»How do I meet the requirements of article 5, point 1 f of the GDPR that personal data needs to be protected from unauthorized access – without impairing my colleagues in their work?«

### For the HR representative

»How can data be easily shared within the team – even in the home office or other external locations – while preventing sensitive information such as employment contracts, references and salary lists from being stored on an open server and viewed by anyone?«

### For the CTO

»How can I ensure that our innovations and intellectual property remain protected from unauthorized access from within – whether it's by an employee or a compromised system?«

**conpal LAN Crypt** enables rule- and role-based granular encryption of files and directories. This allows a company's security officer to ensure that only authorized users have access to the data they need for their work – and only to that data. The encryption solution is invisible to the user when in use, scales from SMB to enterprise, and is set up with just a few clicks. It is based on existing organizational structures and adopts roles and access rights from Active Directory or Identity and Access Management (IAM) directories.

## Would you like to learn how *conpal* LAN Crypt works?

Learn more at [lancrypt.conpal.de](http://lancrypt.conpal.de). We would also gladly demonstrate how to enable role-based access to files.
